Chapter 01

1. Which statement about nutrition’s role in a person’s life is FALSE?
   a. Nutrition is the science of the nutrients in foods and their actions within the body.
   b. Nutrition is the study of human behaviors related to food and eating.
   c. Careless food choices can contribute to chronic disease.
   d. Chronic diseases progress slowly.
   e. A diet is defined as a restrictive food plan designed for weight loss.

ANSWER: e

POINTS: 1

DIFFICULTY: Bloom's: Understand

15. Which of the following statements about essential nutrients is FALSE?
   a. They must be obtained from food.
   b. They are also called indispensable nutrients.
   c. They cannot be made in sufficient quantities by the body.
   d. They meet the body’s physiological needs.
   e. There are about 100 nutrients essential for the human body.

   ANSWER: e
16. What nonnutritive substance contributes energy, but does not sustain life?
   a. Fats
   b. Sugar
   c. Artificial sweeteners
   d. Alcohol
   e. Phytochemicals

   ANSWER: d

17. What happens when the body uses energy-yielding nutrients?
   a. The bonds between the atoms break and release energy.
   b. The body converts them into storage compounds.
   c. A person’s energy stores are depleted.
   d. The amount of water in the body decreases.
   e. A person’s body mass increases.

   ANSWER: a
18. Which energy-yielding nutrients are found in part of the structural component of muscles and help regulate digestion?
   a. Fats
   b. Alcohols
   c. Proteins
   d. Carbohydrates
   e. Vitamins and minerals

34. To be accepted into the body of nutrition knowledge, research findings must stand up to rigorous, repeated testing in experiments conducted by other researchers. This is called ________.
   a. validity
   b. correlation
   c. replication
   d. randomization
   e. anecdotal evidence

ANSWER: c
POINTS: 1
35. Which part of a research article defines key terms, study design, subjects, and procedures?
   a. References
   b. Introduction
   c. Abstract
   d. Methodology
   e. Results

   ANSWER: d
   POINTS: 1

36. You have been asked to help a top nutrition researcher conduct human double-blind experiments on vitamin C. As the subjects walk into the laboratory, you distribute all the vitamin C pill bottles to the girls and all the placebo pill bottles to the boys. The researcher instantly informs you that there are two errors in your research practice. What steps should you have taken to conduct your experiment correctly?
   a. You should have given all the boys the vitamin C and all the girls the placebo, and then told them what they were getting.
   b. You should have distributed the bottles randomly, randomizing the subjects, and then told them what they were getting.
   c. You should have told the subjects which group they were in, while preventing yourself from knowing the contents of the pill bottles.
   d. You should have prevented yourself from knowing what was in the pill bottles, and distributed the bottles randomly to the subjects.
   e. You should have allowed the subjects to decide whether they take vitamin C or the placebo, and then given them the opposite of what they requested.

   ANSWER: d
   POINTS: 1
37. Which of the following is not a category of the Dietary Reference Intake (DRI)?
   a. Estimated Average Requirements (EAR)
   b. Recommended Dietary Allowances (RDA)
   c. Adequate Intakes (AI)
   d. Tolerable Upper Intake Levels (UL)
   e. Anthropometric Measurements (AM)

   ANSWER:  e
   POINTS:  1

38. The lowest continuing intake of a nutrient that will maintain a specified criterion of adequacy is called a nutrient ________.
   a. allowance
   b. requirement
   c. tolerable limit
   d. adequate intake
   e. recommendation

   ANSWER:  b
   POINTS:  1
39. The Estimated Average Requirement (EAR) for a nutrient meets the needs of about _______ of the population.
   a. 5%
   b. 25%
   c. 50%
   d. 75%
   e. 98%

43. Which of the following is defined as the maximum daily amount of a nutrient that appears safe for most people and beyond which there is an increased risk of adverse side effects?
   a. EER
   b. UL
   c. AI
   d. RDA
   e. DRI

ANSWER: b
POINTS: 1
44. Which of the following statements about the Estimated Energy Requirement (EER) is FALSE?
   a. It is the average dietary energy intake that will maintain energy balance in a person with a healthy body weight and level of physical activity.
   b. EER is measured in kilocalories per day.
   c. Food energy is needed to sustain a healthy and active life.
   d. UL for energy are based on a person’s age, gender, weight, and height.
   e. Any dietary intake in excess of energy needs results in weight gain.

ANSWER: d
POINTS: 1

45. What is the Acceptable Macronutrient Distribution Range (AMDR) for carbohydrates?
   a. 5% to 10%
   b. 15% to 20%
   c. 25% to 40%
   d. 45% to 65%
   e. 70% to 80%

ANSWER: d
POINTS: 1
46. Which of the following statements about nutrient recommendations worldwide is FALSE?
   a. Fewer than 20 nations have nutrient standards similar to those in the U.S.
   b. Standards in other countries may reflect differences in data interpretation.
   c. Food habits and physical activities of people in other countries affect their published nutrient standards.
   d. Some countries use recommendations developed by the Food and Agriculture Organization and the World Health Organization.
   e. Nutrient recommendations from international groups are sufficient to maintain health in healthy people worldwide.

POINTS: 1

98. The choices a person makes regarding food are highly personal. List and describe five factors that influence a person’s food choices.
ANSWER: Preferences: As you might expect, the number one reason most people choose certain foods is taste—they like the flavor. Two widely shared preferences are for the sweetness of sugar and the savoriness of salt. High-fat foods also appear to be a universally common preference.
Habit: People sometimes select foods out of habit. They eat cereal every morning, for example, simply because they have always eaten cereal for breakfast. Eating a familiar food and not having to make any decisions can be comforting.
Ethnic Heritage and Regional Cuisines: Among the strongest influences on food choices are ethnic heritage and regional cuisines. People tend to prefer the foods they grew up eating. Every country, and in fact every region of a country, has its own typical foods and ways of combining them into meals. These cuisines reflect a unique combination of local ingredients and cooking styles.
Marketing: Food companies spend billions of dollars building brand loyalty and enticing busy customers with convenience foods.
Social Interactions: Most people enjoy companionship while eating. It’s fun to go out with friends for a meal or share a snack when watching a movie together. Meals are often social events, and sharing food is part of hospitality. Social customs invite people to accept food or drink offered by a host or shared by a group—regardless of hunger signals.
Availability, Convenience, and Economy: People often eat foods that are accessible, quick and easy to prepare, and within their financial means. Consumers who value convenience frequently eat out, bring home ready-to-eat meals, or have food delivered.
Positive and Negative Associations: People tend to like particular foods associated with happy occasions—such as hot dogs at ball games or cake and ice cream at birthday parties. By the same token, people can develop aversions and dislike foods that they ate when they felt sick or that they were forced to eat in negative situations. Similarly, children learn to like and dislike certain foods when their parents use foods as rewards or punishments.
Emotions: Emotions guide food choices and eating behaviors. Some people cannot eat when they are emotionally upset. Others may eat in response to a variety of emotional stimuli—for example, to relieve boredom or depression or to calm anxiety.
Chapter 01

Values: Food choices may reflect people's religious beliefs, political views, or environmental concerns.
Body Weight and Image: Sometimes people select certain foods and supplements that they believe will improve their physical appearance and avoid those they believe might be detrimental. Such decisions can be beneficial when based on sound nutrition and fitness knowledge, but decisions based on fads or carried to extremes undermine good health.
Nutrition and Health Benefits: Many consumers make food choices they believe will improve their health.

99. Name and describe the energy-yielding nutrients. How is the energy measured? How does the body use energy?

**ANSWER:** The energy-yielding nutrients are carbohydrates, fat, and protein, which are measured in calories or kcalories. Because fat provides the most energy, it has the highest energy density—9 kcalories per gram. Carbohydrates and protein each yield 4 kcalories per gram. When the body uses carbohydrate, fat, or protein to fuel its activities, the bonds between the nutrient's atoms break. As the bonds break, they release energy. Some of this energy is released as heat, but some is used to send electrical impulses through the brain and nerves, to synthesize body compounds, and to move muscles. Thus, the energy from foods supports all of the body's movements from quiet thought to vigorous sports. If the body does not use these nutrients to fuel its current activities, it converts them into storage compounds, to be used between meals and overnight when fresh energy supplies run low. If more energy is consumed than expended, the result is an increase in energy stores and weight gain.

100. Describe the double-blind technique and why it is important to research studies. Include a discussion of the importance of controls.

**ANSWER:** Double Blind: When both the subjects and the researchers do not know which subjects are in which group, the study is called a double-blind experiment. Being fallible human beings and having an emotional and sometimes financial investment in a successful outcome, researchers might record and interpret results with a bias in the expected direction. To prevent such bias, the pills are coded by a third party, who does not reveal to the...
experimenters which subjects are in which group until all results have been recorded. 

**Controls:** Research studies include control groups, which are similar in all possible respects to the experimental group, except for the treatment. This is accomplished through randomization. Ideally, the control group receives a placebo while the experimental group receives the real treatment.

**POINTS:** 1 
**DIFFICULTY:** Bloom's: Understand  
**REFERENCES:** 1.3 The Science of Nutrition  
**QUESTION TYPE:** Essay  
**HAS VARIABLES:** False  
**LEARNING OBJECTIVES:** UNUT.WHRO.16.1.3 - Explain the scientific method and how scientists use various types of research studies and methods to acquire nutrition information.

101. Compare and contrast the four categories of Dietary Reference Intakes (DRIs).

**ANSWER:** Estimated Average Requirements (EAR): The committee reviews hundreds of research studies to determine the requirement for a nutrient—how much is needed in the diet. The committee selects a different criterion for each nutrient based on its roles in supporting various activities in the body and in reducing disease risks. An examination of all the available data reveals that each person’s body is unique and has its own set of requirements. Men differ from women, and needs change as people grow from infancy through old age. For this reason, the committee clusters its recommendations for people into groups based on gender and age. Even so, the exact requirements for people of the same gender and age are likely to be different. Using this information, the committee determines an Estimated Average Requirement (EAR) for each nutrient—the average amount that appears sufficient for half of the population.

Recommended Dietary Allowances (RDA): Once a nutrient requirement is established, the committee must decide what intake to recommend for everybody—the Recommended Dietary Allowance (RDA). The EAR is probably closest to everyone’s need. If people consumed exactly the average requirement of a given nutrient each day, however, approximately half of the population would develop deficiencies of that nutrient. Recommendations are therefore set greater than the EAR to meet the needs of most healthy people.

Adequate Intakes (AI): For some nutrients, such as vitamin K, there is insufficient scientific evidence to determine an EAR (which is needed to set an RDA). In these cases, the committee establishes an Adequate Intake (AI) instead of an RDA. An AI reflects the average amount of a nutrient that a group of healthy people consumes. Like the RDA, the AI may be used as nutrient goals for individuals.

Tolerable Upper Intake Levels (UL): The recommended intakes for nutrients are generous, yet they may not be sufficient for every individual for every nutrient. Nevertheless, it is probably best not to exceed these recommendations by very much or very often. Individual tolerances for high doses of nutrients vary, and somewhere beyond the recommended intake is a point beyond which a nutrient is likely to become toxic. This point is known as the Tolerable Upper Intake Level (UL).

**POINTS:** 1 
**DIFFICULTY:** Bloom's: Understand

Chapter 01

**LEARNING OBJECTIVES:** UNUT.WHRO.16.1.4 - Define the four categories of the DRI and explain their purposes.

**DATE CREATED:** 10/31/2017 7:54 AM

**DATE MODIFIED:** 10/31/2017 8:05 AM

102. Why are the EER and AMDR such important metrics?

**ANSWER:** Estimated Energy Requirement (EER): The energy recommendation—called the Estimated Energy Requirement (EER)—represents the average dietary energy intake (kcalories per day) that will maintain energy balance in a person who has a healthy body weight and level of physical activity. Balance is key to the energy recommendation. Enough food energy is needed to sustain a healthy and active life, but too much can lead to weight gain and obesity. Because any amount in excess of energy needs will result in weight gain, no upper level for energy has been determined.

Acceptable Macronutrient Distribution Ranges (AMDR)

People don’t eat energy directly; they derive energy from foods containing carbohydrates, fats, and proteins. Each of these three energy-yielding nutrients contributes to the total energy intake, and those contributions vary in relation to one another. The DRI committee has determined that the composition of a diet that provides adequate energy and nutrients and reduces the risk of chronic diseases is:

- 45 to 65 percent kcalories from carbohydrate
- 20 to 35 percent kcalories from fat
- 10 to 35 percent kcalories from protein.

103. Explain how the four assessment methods are used to detect energy and nutrient deficiencies and excesses.

**ANSWER:** To prepare a nutrition assessment, a registered dietitian (or registered dietitian nutritionist), dietetic technician registered, or other trained health-care professional uses:

- Historical information
- Anthropometric measurements
- Physical examinations
- Laboratory tests

One step in evaluating nutrition status is to obtain information about a person’s history with respect to health status, socioeconomic status, drug use, and diet. The health history reflects a person’s medical record and may reveal a disease that interferes with the person’s ability to eat or the body's use of nutrients. The person’s family history of major diseases is also noteworthy, especially for conditions such as heart disease that have a genetic tendency to run in families. Economic circumstances may show a financial inability to buy foods or inadequate kitchen facilities in which to prepare them. Social factors such as marital status, ethnic background, and educational level also influence food choices and nutrition status. A drug history, including all prescribed and over-the-counter medications, may highlight possible interactions that lead to nutrient deficiencies.

A second technique that may help to reveal nutrition problems is taking anthropometric measures such as height and weight. The assessor compares a person’s measurements...
Chapter 01

with standards specific for gender and age or with previous measures on the same individual.
A third nutrition assessment technique is a physical examination looking for clues to poor nutrition status. Visual inspection of the hair, eyes, skin, posture, tongue, and fingernails can provide such clues. In addition, information gathered from an interview can help identify symptoms. The examination requires skill because many physical signs and symptoms reflect more than one nutrient deficiency or toxicity—or even non-nutrition conditions. Like the other assessment techniques, a physical examination alone does not yield firm conclusions. Instead, physical examinations reveal possible imbalances that must be confirmed by other assessment techniques, or they confirm results from other assessment measures.
A fourth way to detect a developing deficiency, imbalance, or toxicity is to take samples of blood or urine, analyze them in the laboratory, and compare the results with normal values for a similar population. Laboratory tests are most useful in uncovering early signs of malnutrition before symptoms appear. In addition, they can confirm suspicions raised by other assessment methods.

104. Imagine that you are in charge of *What We Eat in America*, a national nutrition survey. Some people have suggested eliminating the survey due to budget constraints. How would you respond?

**ANSWER:** National nutrition surveys gather information about the population’s dietary, nutritional, and related health status. The data provide valuable information on several nutrition-related conditions, such as growth retardation, heart disease, and nutrient deficiencies. National nutrition surveys often oversample high-risk groups (low-income families, pregnant women, adolescents, the elderly, African Americans, and Mexican Americans) to glean an accurate estimate of their health and nutrition status. The resulting wealth of information from the national nutrition surveys is used for a variety of purposes. For example, Congress uses this information to establish public policy on nutrition education, food assistance programs, and the regulation of the food supply. Scientists use the information to establish research priorities. The food industry uses these data to guide decisions in public relations and product development. The Dietary Reference Intakes and other major reports that examine the relationships between diet and health depend on information collected from these nutrition surveys. These data also provide the basis for developing and monitoring national health goals.

105. How are risk factors for chronic diseases determined? What do they mean?

ANSWER: Factors that increase or reduce the risk of developing chronic diseases can be identified by analyzing statistical data. A strong association between a risk factor and a disease means that when the factor is present, the likelihood of developing the disease increases. It does not mean that all people with the risk factor will develop the disease. Similarly, a lack of risk factors does not guarantee freedom from a given disease. On the average, though, the more risk factors in a person’s life, the greater that person’s chances of developing the disease. Conversely, the fewer risk factors in a person’s life, the better the chances for good health.

106. Imagine that a friend tells you she was watching her favorite morning news program on television and saw a segment featuring a story on “surprising new findings” about the health benefits of a new over-the-counter product. She found the product at her local drugstore and shows you the package. What advice would you give her regarding her latest discovery?

ANSWER: Consumers get much of their nutrition information from Internet websites, television news, and magazine articles, which have heightened awareness of how diet influences the development of diseases. Consumers benefit from news coverage of nutrition when they learn to make lifestyle changes that will improve their health. Sometimes, however, popular reports mislead consumers and create confusion. They often tell a lopsided story quickly instead of presenting the integrated results of research studies or a balance of expert opinions. Tight deadlines and limited understanding sometimes make it difficult to provide a thorough report. Hungry for the latest news, the media often report scientific findings quickly and prematurely—without benefit of careful interpretation, replication, or peer review. Usually, the reports present findings from a single, recently released study, making the news current and controversial. Consequently, the public receives diet and health news fast, but not always in perspective. Reporters may twist inconclusive findings into “meaningful discoveries” when pressured to write catchy headlines and sensational stories.

As a result, “surprising new findings” sometimes seem to contradict one another, and consumers may feel frustrated and betrayed. Occasionally, the reports are downright false, but more often the apparent contradictions are simply the normal result of science at work. A single study contributes to the big picture, but when viewed alone, it can easily distort the image. To be meaningful the conclusions of any study must be presented cautiously within the context of other research findings.

Additionally, there are eight red flags revealing nutrition quackery on product packages or in marketing materials. These include: The word “natural,” quick and easy fixes, the promise of satisfaction, the idea that one product does everything, the notion of being time tested or brand new, paranoid accusations, personal testimonials, and meaningless...
107. Imagine that a friend is contemplating a change in college major. He has always had an interest in healthy living and knows he does not want to work in an office setting. You think he should consider becoming a registered dietitian. What would you tell him about the necessary training and career possibilities?

**ANSWER:** A registered dietitian nutritionist (RDN) has the educational background necessary to deliver reliable nutrition advice and care. To become an RDN, a person must earn an undergraduate degree requiring about 60 credit hours in nutrition, food science, and other related subjects; complete a year’s clinical internship or the equivalent; pass a national examination administered by the Academy of Nutrition and Dietetics; and maintain up-to-date knowledge and registration by participating in required continuing education activities, such as attending seminars, taking courses, or conducting research.

Dieticians perform a multitude of duties in many settings in most communities. They work in the food industry, pharmaceutical companies, home health agencies, long-term care institutions, private practice, public health departments, research centers, education settings, fitness centers, and hospitals. Depending on their work settings, dieticians can assume a number of different job responsibilities and positions. In hospitals, administrative dieticians manage the foodservice system; clinical dieticians provide client care; and nutrition support team dieticians coordinate nutrition care with other health-care professionals. In the food industry, dieticians conduct research, develop products, and market services.
